WPI: 99-018070/02
WRY beta-hetero:dimeric polypeptide derivs. - which bind to luteinising and follicle stimulating hormone receptors, useful for controlling the ratio of FSH to LH activity
Disclosure: page 20; 98pp; English.
The sequence is that of the beta-subunit of human thyroid stimulating hormone which was used in the creation of a beta-subunit peptide analogue as part of an alpha, beta-heterodimeric polypeptide having an affinity to vertebrate luteinising hormone (LH) receptors and vertebrate follicle stimulating homone (FSH) receptors. This can be used for treating human infertility or polycystic ovarian disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 14-MAY-1993 (first entry)

New stabilised glycoprotein hormones - particularly hGG, hiH, hFSH or hTSH, have an intersubunit disulphide crosslink between the alpha- and beta-subunits to improve stability

Disclosure; Fig 38; 139pp; English.

Disclosure; Fig 38; 139pp; English.

The invention relates to the production of analogues of a heterodimeric subunit glycoprotein hormone (GPH) e.g. human chorionic gonadorropin (hCG), human luteinising hormone (LHH), human follicle stimulating hormone (hFSH), human thyroid stimulating hormone (hTSH), and functional muteins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for improved stability, the analogue retaining at least a portion of the bioactivity for the corresponding native GPH receptor. This sequence represents a mutant hTSH-beta subunit used for the generation of the modified GPHs. The improved analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have as for the native GPHs analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      or hTSH, have an intersubunit disulphide crosslink between the alphare and beta-subunits to improve stability
or hTSH, have an intersubunit disulphide crosslink between the alphare and beta-subunits to improve stability
bisclosure; Fig 39; 139pp; English.
The invention relates to the production of analogues of a heterodimeric subunit glycoprotein hormone (GFH) e.g. human chorionic gonadotropin (hCG), human luteinishing hormone (hLH), human clorionic gonadotropin commone (hESH), human thyroid stimulating hormone (hTSH), and functional hormone (hLH), human intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for improved stability, the analogue retaining at least a portion of the bloactivity for the corresponding native GPH receptor. This sequence crepresents a mutant hTSH-beta subunit used for the generation of the modified GPHs. The improved analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      hTSH-beta analogue hTSH-beta-FIC.

Wew glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.

Table III; Page 62; 94pp; English.

The sequence is an analogue of mature hCG beta subunit having residues 74, 75, 77, 79, 80 and 83 replaced by the corresponding residues in the hTSH protein. The chimeric hormone may be useful as a TSH antagonist for the treatment of hyperthyroidism.

See RISO61-RI5125 and RI5161-RI5198.

                                                                                                                                        ö
thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have agonistic activity on them. The changes stabilise the GPHs and prolong the biological activities of the hormones. The analogues can have uses as for the native GPHs.

The beta subunit (R99419) of human thyroid stimulating hormone (TSH) is encoded by an engineered genomic DNA fragment (T41697). Expression levels of recombinant TSH in mammalian (e.g. CHO) host cells are higher when cells are cotransfected with a vector including the beta subunit DNA and a vector including the beta subunit DNA and a vector including alpha subunit genomic DNA. When only alpha subunit cDNA is available, expression is improved by addition of an intron sequence into the

Chorionic gonadotrophin beta subunit carboxy-terminal loop mutant.
Human: Chorionic gonadotrophin; chorionic gonadotropin; beta-hCG;
beta subunit; carboxy terminal loop; mutant; reduction; vaccine;
contragestative medicament; cross-reactivity; luteinising hormone;
contraceptive; immunoassay; Kaposi sarcoma; inhibition; LH;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Campbell RK, Moyle WR;

This method of production of fish gonadotropin (GTH) utilises recombinant DNARNA techniques. RNA isolated from white salmon pituitary glands is used as a template for DNA synthesis by way of reverse transcriptase (RT) The DNA (ds) is insered into a vector and eg E.coli are transformed.

The GTH product is thus inexpensively mass produced and can be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Fish gonadotropin gene of specified peptide sequence – obtd. by prepn. of complete RNA from white salmon pituitary gland, passing through cellulose

The modified brea-hCG has reduced cross-reactivity with luteinising hormone (LH), as defined by the ability of both proteins to react with the same antibody. The modified beta-hCG can be used as a contraceptive in females, in a vaccine, in a hCG specific immunoassay and for apilications where hCG is active, e.g. Raposi sarcoma inhibition. The modified beta-hCG can produce neutralising antibodies to beta-hCG, which do not cross-react with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       N.B. Sequence not given in the specification, but constructed using the wild type beta-hCG sequence given in nature 307 959460, 37-40 (1984).
                                                                                                                                                                                                                                                                                                                                                                                                                                            Chorionic gonadotrophin beta subunit carboxy-terminal loop mutant. Human; chorionic gonadotrophin; chorionic gonadotrophin; beta-hGG; beta subunit; amino-terminal loop; mutant; reduction; LH; vaccine; contragestative medicament; cross-reactivity; luteinising hormone; contraceptive; immunoassay; Raposi sarcoma; inhibition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       01-070-1991 (first entry)
Sequence of human beta luteinising hormone (LH).
Contraceptive; fertility control; vaccine; reproductive hormone.
                                                                 ö

Disclosure; Fig 37: 139pp; English.

The invention relates to the production of analogues of a heterodimeric subunit glycoprotein hormone (GPH) e.g. human fobrionic gonadotropin (hGG), human luteinising hormone (hHH), human follicle stimulating hormone (hFSH), and functional muteins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for improved stability, the analogue retaining at least a portion of the bioactivity for the corresponding native GPH receptor. This sequence represents a mutant hiH-beta subunit used for the generation of the modified GPHs. The improved analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer will be formed dimer will have affainity for the native receptors and have agonistic activity on them. The changes stabilise the GPHs and prolong
                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the biological activities of the hormones. Example: Fig 4: 101pp: English.
The patentors claim a vaccine effective against mammalian fertility comprising a vaccinia virus genome having disposed unit, in a non-essential region, a DNA sequence of formula : (Hormone)n: n= 1-20; Hormone—DNA sequence derived from the sequence encoding a reproductive hormone. The hormone is esp. LH, GRRH, CG or FSH.

New stabilised glycoprotein hormones - particularly hGG, hLH, hFSH or hTSH, have an intersubunit disulphide crosslink between the production or hTSH, have an intersubunit disulphide crosslink between the produce authorised subunits to improve stability bisclosure; Fig 36; 139pp; English.

Disclosure; Fig 36; 139pp; English.

Disclosure; Fig 36; 139pp; English.

The invention relates to the production of analogues of a heterodimeric subunit glycoprotein hormone (GPH) e.g. human chorionic gonadorropin (hGG), human luteinising hormone (HHH), human chormone (HTSH), and functional muteins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for muteins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine of the bloactivity for the corresponding native GPH receptor. This sequence crepresents a mutant hill beta subunit used for the generation of the modified GPHs. The improved analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have agonistic activity on them. The changes stabilise the GPHs and prolong the biological activities of the hormones. The analogues can have uses
                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Example 12; Page 90; 139pp; English.

Crosslink between the production of analogues of a heterodimeric subunit glycoprotein hormone (GPH) e.g. human chorizonic gonadotropin (hCG), human luteinising hormone (hLH), human chorizonic gonadotropin (hCG), human luteinising hormone (hLH), human chorizonic gonadotropin chormone (hFSH), human thyroid stimulating hormone (hTSH), and functional muteins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine, for improved stability, the analogue retaining at least a portion of the bloactivity for the corresponding native GPH receptor. This sequence therefore the improved analogues are designed specifically to represents a mutated hull-beta subunit used for the generation of the modified GPHs. The improved analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have agonistic activity on them. The changes stabilise the GPHs and prolong the boots.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Analogue, heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human choritonic gonadotropin; human luteinising hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI: 99-081219/07.
New stabilised glycoprotein hormones - particularly hCG, hLH, hFSH or hTSH, have an intersubunit disulphide crosslink between the alpha- and beta-subunits to improve stability between the alpha- and beta-subunits to improve stability brangle 12; Page 90; 139pp; English.
The invention relates to the production of analogues of a heterodimeric subunit glycoprotein hormone (GPH) e.g. human chorionic gonadotropin (hCG), human luteinising hormone (hLH), human follicle stimulating hormone (hTSH), and functional muteins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
improved stability, the analogue retaining at least a portion of the bioactivity for the corresponding native GPH receptor. This sequence represents a mutated hith-beta subunit used for the generation of the modified GPHs. The improved analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have agonistic activity on them. The changes stabilise the GPHs and prolong the biological activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Glycoprotein hormone analogue hLH-beta-T40C.
Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human chorionic gonadotropin; human luteinising hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation.

or hTSH, have an intersubunit disulphide crosslink between the alpha- and beta-subunits to improve stability

Example 12; Page 90; 139pp; English.

The invention relates to the production of analogues of a heterodimeric subunit glycoprotein hormone (GPH) e.g. human chorionic gonadotropin (hCG), human luteinising hormone (hLH), human follicle stimulating normone (hCSH), and functional nuteins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit disulphide bond, muteins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit disulphide bond, improved stability, the analogue retaining at least a portion of the bioactivity for the corresponding native GPH receptor. This sequence corpresents a mutated hLH-beta subunit used for the generation of the modified GPHs. The improved analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have agonistic activity on them. The changes stabilise the GPHs and prolong the biological activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI: 99-081219/07.

New stabilised glycoprotein hormones - particularly hCG, hLH, hFSH

New stabilised glycoprotein hormones - particularly hCG, hLH, hFSH

To hTSH, have an intersubunit disulphide crosslink between the

Talpha- and beta-subunits to improve stability

CC subunit glycoprotein hormone (GPH) e.g. human chorionic gonadotropin

C(hGG), human luteinising hormone (HHH), human follicle stimulating

ChGG), human luteinising hormone (HHH), human follicle stimulating

ChGG), human luteinising hormone (HHH), human follicle stimulating

CC muteins, which are modified to contain an intersubunit disulphide bond,

CC muteins, which are modified to contain an intersubunit disulphide bond,

CC contains, which are modified to contain an intersubunit disulphide bond,

CC containty for the corresponding native GPH receptor. This sequence

CC ploactivity for the corresponding native GPH receptor. This sequence

CC ploactivity for the corresponding native GPH receptor. This sequence

CC ploactivity for the corresponding native GPH receptor.

CC reduce perturbation of the 3-dimensional structure of the hormone,

CC reduce perturbation of the 3-dimensional structure of the hormone,

CC add the formed dimer will have affainity for the native receptors and have

CC agonistic activity on them. The changes stabilise the GPHs and prolong

CC afformed activities of the hormones. The analogues can have uses

CC as for the native GPHs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                              Glycoprotein hormone analogue hLH-beta-M42C. Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human chorionic gonadotropin; human luteinising hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New stabilised glycoprotein hormones - particularly hCG, hLH, hFSH or hTSH, have an intersubunit disulphide crosslink between the alpha- and beta-subunits to improve stability

Example 12; Page 90; 139pp; English,

Example 12; Page 90; 139pp; English,

Che invention relates to the production of analogues of a heterodimeric subunit glycoprotein hormone (GPH) e.g. human chorionic gonadorropin (hCG), human luteinising hormone (hHH), human chorionic gonadorropin (hCG), human luteinising hormone (hHH), human chorionic gonadorropin chormone (hFSH), human thyroid stimulating hormone (HTSH), and functional muteins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for improved stability, the analogue retaining at least a portion of the bloactivity for the corresponding native GPH receptor. This sequence crepresents a mutated hist-beta subunit used for the generation of the modified GPHs. The improved analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, chereby creating greater likelihood that the dimer will be formed dimer will have affinity for the native receptors and have agonistic activity on them. The changes stabilise the GPHs and prolong the both of the contained of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

New stabilised glycoprotein hormones - particularly hCG, hLH, hFSH or hTSH, have an intersubunit disulphide crosslink between the appara and beta-subunits to improve stability

Example 12; Page 90: 139pp; English.

Example 12; Page 90: 139pp; English.

The invention relates to the production of analogues of a heterodimeric subunit glycoprotein hormone (GPH) e.g. human chorionic gonadotropin (hCG), human luteinising hormone (hHH), human chorionic gonadotropin (hCG), human luteinising hormone (hHH), human chorionic disulphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for improved stability, the analogue retaining at least a portion of the bloactivity for the corresponding native GPH receptor. This sequence corpresents a mutated hiH-beta subunit used for the generation of the modified GPHs. The improved analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer will be formed dimer will have affinity for the native receptors and have agonistic activity on them. The changes stabilise the GPHs and prolong the bloadless and have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   08-JUN-1999 (first entry)

Example 12; Page 90; 139pp; English.

The invention relates to the production of analogues of a heterodimeric subunit glycoprotein hormone (GFH) e.g. human chorionic gonadotropin (hCG), human luteinising hormone (hLH), human follicle stimulating hormone (hFSH), and functional muteins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine, for improved stability, the analogue retaining at least a portion of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Length 141;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (ISTF ) ARS APPLIED RES SYSTEMS HOLDING NV.                 represents a mutated his beta subunit used for the generation of the modified GPHs. The improved analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have agonistic activity on them. The changes stabilise the GPHs and prolong the biological activities of the hormones. The analogues can have uses sequence 141 AA;

acid (esp. Gln) to remove a glycosylation
site"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WP() 95-302553/39.

Methods for altering fertility in mammals, esp. humans - e.g.

Methods for altering fertility by reducing the activity and/or levels of

circulating glyco:protein hormones having lutropin activity

Example 24: Fig 8 and Page 60; 102pp; English.

The single-chain gonadotropin analogue 3a (human LH-beta(1-114)

[M30X]-linker-human CG-alpha(1-92)[N52X,N78X]) can be derived

from analogue 3 by removing at least one of the glycosylation

sites. The partially deglycosylated analogue has anti-luteinising

hormone (lutropin) activity and can be used for facilitating

ovulation, terminating pregnancy and reducing androgen secretion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            alpha-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "wild-type Asn at position 30 of the beta-

Nethods for altering fertility in mammals, esp. humans - e.g. stimulating fertility by reducing the activity and/or levels of circulating glyco:protein hormones having lutropin activity Example 14; Fig 8; 102pp; English.

Example 14; Fig 8; 102pp; English.

Analogue 3 (human LH-beta(1-114)-linker-human-alpha(1-92)) is a specific example.of a single chain gonadotropin; chimeric proteins Having a chorionic gonadotropin (CG) beta-subunit at the N-terminus and a CG alpha-subunit at the C-terminus, joined by a linker of 1-16 amino acids are claimed. The analogue has luteinising hormone (lutropin) activity and is useful for inducing ovulation and increasing male fertility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                          Single chain gonadotropin analogue 3.
Single chain gonadotropin; human chorionic gonadotropin; hCG; alpha; beta; subunit; analogue; glycoprotein hormone; fertility; inhibit; stimulate; increase; lutropin; luteinising hormone; LH; follicle stimulating hormone; FSH; vaccine; contraceptive.

N-PSDB; N61379.

New DNA coding for porcine beta-follicle stimulating hormone - useful for raising antibodies, inducing ovulation etc., and new expression vectors.

Disclosure; Page 3; 14pp; French.

Total RNA is extracted from pig hypophyseal glands and used to construct a library of cDNA. The library was screened using two oligonucleotide probes designated PF55 and PF444. These were ligated to give the complete sequence including the untranslated flanking regions. This sequence has been inserted into pBR322 and denomitted as NRRL B-15793. The final vector is ppFSH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure; Fig 2; 28pp; English. The sequences given in R56767 and R68979 represent fragments of the human follicle stimulating hormone (FSH) beta subunit encoded

T Recombinant ovine follicle stimulating hormone - used for induing or increasing ovulation in female animals and improving yield of ova.

Disclosure; Fig 1a: 22pp; English.

Disclosure; Fig 1a: 22pp; English.

Tracted from lamb pituitary glands, using probes based on the pubtracted from lamb pituitary glands, using probes based on the pubtracted from lamb pituitary glands, using probes based on the pubtracted from lamb pituitary glands, using probes based on the pubtracted from lamb pituitary glands, using probes based on the pubtracted from lamb pituitary glands, using probes based on the pubtracted maino acid sequence deduced from the sequence is compared to with this, two conservative substitutions and a single C-terminal.

AA exclusion were noted (details not given). The DNA is used to produce the protein by recombinant techniques. The protein can be used control ovulation and improve embryo viability in sheep and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence is an analogue of mature hCG beta subunit having residues 59-64, 66, 67, and 69 replaced by the corresponding residues in the hFSH protein. It was prepd. by site directed mutagenesis of a CDNA sequence encoding the hCG beta subunit. The chimeric hormone is capable of directing hormone binding to both hIH and RSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals. (See R15043, R15061-R15125 and R15161-R15198).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.

from detectable traces of luteinising hormone and other urinary hormones. Claim 1; page 21; 32pp; English. Residues 1(Asn) and 2(Ser) are optional. The peptide has 111 amino acids instead of 118 or 108 as reported for the known FSH beta subunit. It was purified from human menopausal gonadotrophin. Together with an alpha subunit (sequence known from J. Biol. Che. 250, 6735 (1975) ) the protein forms an FSH protein which can be used to treat infertility.
                                                                                    Urinary follicle stimulating hormone – is biologically active and free

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
by exons II and III. This sequence was used in the production of an extended FSH beta subunit in which the carboxy terminal peptide, ie. residues 112-118 to 145, of human chorionic gonadotrophin beta subunit to position 110 of wild type FSH beta subunit. The modified form of the FSH beta subunit enhances the rate of dimerisation and secretion of dimers and individual chains. An FSH alpha-beta heterodimer is useful in a pharmaceutical composition for therapeutic use in the regulation of metabolism pertinent to reproduction in human

A probe based on amino acids 94-107 of exon III of human FSH-bet was used to isolate an FSH-beta gene (091983) from a library of human placental JAr choriocarcinoma genomic DNA in lambda MG3.
Exon II of the gene encoded the signal peptide and amino acids
                                                                                                                                                                                                    ö

The sequence is that of the beta-subunit of human follicle stimulating hormone which was used in the creation of a beta-subunit peptide analogue as part of an alpha, beta-heterodimeric polypeptide having an affinity to vertebrate luteinising hormone (LH) receptors and vertebrate follicle stimulating homone (FSH) receptors. This can be used for treating human infertility or polycystic ovarian disease.

The amino acid sequence is identical to that reported by Watkins,
The amino acid sequence is identical to that reported by Watkins,
T.C. et al. DNA (1987) 6:205-212. But the carboxy terminal
sequence PYPALSY reported by Saxena, D.B., J Biol Chem (1976) 251:
993-1005 is found neither in the sequence represented here, nor in
the protein based sequence reported by Shome, B., et al., J Clin
Endocrinol Metab (1974) 39:203-203. A more recent determination of
the amino acid sequence confirms the sequence deduced from the DNA
(Stone, B. et al., J Prot Chem (1988) 7:355-339.
An important modification of the beta-FSH chain encoding DNA is
obtained when the 34 amino acid carboxy terminal peptide of the
chorionic gonadotropin beta chain is fused to the C-terminus.
In this form of the hormone, the C-terminal Glu of FSH beta at
position 111 is extended with the amino acid sequence representing
containing maino acids 112-118 to 145 of the beta G sequence.
The recombinant hormone can be produced with altered glycosylation
or activity patterns. It can be used to regulate repoductive
circulating half-life in the body.
Sequence 129 AA;
                                                          23-JAN-1991 (first entry)
Human follicle-stimulating hormone beta.
Human follicle-stimulating hormone-beta; FSH; modification; metabolism; reproductive disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modified forms of fsh, lh, cg and tsh - efficiently produced and secreted by recombinant techniques with altered glycosylation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ATAR-1991 (first entry)
Engineered partial human FSH beta subunit.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New 9170-DTG/TOTAL NOT MODE analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.

Table II; Page 61; 94pp; English.

The sequence is an analogue of mature hFSH beta subunit having several residues replaced by the corresponding residues in the hCG protein. The chimmeric hormone is capable of directing hormone binding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of RFSIII fertility in male and female animals. (See RISO43, RISO61-RISI25 and RISO61-RISI29).
                                                                                                                                                                                       New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.

Genomic DNA from JAr choriocarcinoma cells (a human placental donor)
Committee of create a library which was screened by a 41 mer corresp.
Committee of expensive the corresp.
Committee of expensive of expensive of expensive of committee of expensive of clones isolated. Sequencing revealed that the coding sequence is divided into three exons. Exon I contains a 5' untranslated tract.
Corresponding reported to encode two transcripts of either 33 or 63 bp.
Exon II encodes an 18 amino acid signal peptide and amino acids 1.35 of the mature protein. Exon III encodes amino acids 36-111 and ca.
Cof the mature protein. Exon III encodes amino acids 36-111 and ca.
Cof the mature protein. Exon III and III by an intron of 1.4 kb. The notation "nn" in the sequence represents apps in the sequence of given in the specification, of 0.7 kb in the first intron, 1.35 kb in the second intron and of 0.55 kb in the 3' untranslated sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Increased recombinant protein production - esp. heteropolymeric glycoprotein homones, uses DNA contg. at least one intron Example 1; Page 16-17; 26pp; English.
The beta subunit (R99418) of human follicle stimulating hormone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modified luteinising hormone beta-sub-unit - shows enhanced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ability to dimerise and enhanced secretion as a dimer from recombinant host cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ouery Match 53.2%; Score 91; DB 1; Length 129

The partial FSH protein is encoded by a 2000bp DdeI-Sau3A segment comprising the protein coding region of exon II in addition to 40bp upstream of the start ATG, the protein coding region of exon III and then it was inserted into the XhoI site of the CLH3AXSV2ODC expression vector which contains a murine ornithine decarboxylase coding region. The vector was used in a comparison of engineered CDNA alpha-subunit with the full-length alpha-subunit. See also Q10075 and Q10077.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New active hetero-dimeric human follicle stimulating hormone - is obtd. from single culture of transformed cells and post-translational modification may occur.

Example: Page 10: 25pp; English.

The beta-subunit of human FSH synthesised by a cell comprising an expression vector comprising heterologous DNA encoding the beta-subunit of FSH. The cells are mammalian. For prodn. of the beta-subunit, the vector comprises at least the 69% transforming region of the bovine papilloma virus genome. The cell is a mouse cell and the expression vector comprises a plasmid, e.g. deposited as NRRL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is the complete sequence of human beta follicle stimulating hormone (hish), containing both shubinits. The protein has been used as part of a novel process for producing a biologically active heterodiment of human fertility hormone selected from human chorionic genadotropin (hCG), human fertility hormone (hLH) and human follicle stimulating hormone (hESH). The method comprises transforming a eukaryotic cell with at least one vector constructed so as to insert into the cell DNA coding for each of the two subunits of the hormone (the translation of the DNA of each subunit being controlled by a separate promoter) and culturing the cell under conditions appropriate to hormone expression. The eukaryotic cell is one which permits appropriate post-translational modification of the subunits, so that the formed protein is biologically active. The method can be used for production of the hormones for uses associated with human fertility. They can be used to induce ovulation or superovulation of the intin of extility and

Dr. Production of recombinant, biologically active hormone - for production of recombinant, biologically active hormone, useful for production of recombinant, biologically active hormone, useful to induce ovulation for in vitro fertilisation claim 4: Columns 13-14; 27pp; English.

Claim 4: Columns 13-14; 27pp; English.

Christ is the complete sequence of human beta follicle stimulating hormone (hFSH); containing both subunits. The protein has been used as part of a process for producing a biologically active heterodimeric human formone selected from human chorionic gonadotropin (hGS), human fertility hormone selected from human chorionic gonadotropin (hGS), human controlising hormone (hLH) and human follicle stimulating hormone (hFSH).

The method comprises transforming a cukaryotic cell with at least one vector constructed so as to insert into the cell DNA coding for each true two subunits of the hormone (the translation of the DNA of each subunit being controlled by a separate promoter) and culturing the cell under conditions appropriate to hormone expression. The cukaryotic cell is one which permits appropriate post-translational modification of the subunits, so that the formed protein is biologically active. The method can be used for production of the hormones for uses associated with human fertility. They can be used to induce ovulation or superovulation of the control of the hormone for uses associated with the form of the long controlled by a separate for induce ovulation or superovulation of the control of the hormone for uses associated with the form of the long controlled by a separate for induce ovulation or superovulation or in diagnostic tests for fertility and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                               Human beta follicle stimulating hormone.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence is the human follicle-stimulating hormone (FSH) beta chairs sequence is the human follicle-stimulating hormone (FSH) beta chair. The protein can be modified to give a protein of the invention that retains the biological activity of the parent protein. The modified protein comprises an extension of the carboxy terminus of the parent protein with an amino acid sequence of the carboxy-terminal peptide (CTP) of human chorionic gonadorropin (HCG) beta-subunit, consisting of amino acids 112-118 to amino acids 145 of HCG, or a variant that differs from the CTP by 1-5 conservative amino acid substitutions. The parent protein is preferably a peptide hormone, especially FSH. A fusion protein comprising FSH beta chain fused to the CTP of HCG is very efficiently produced and secreted and may have an extended half-life in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            In Figh. Volume 1. Useful with DNA encoding luteinising hormone beta subunit - useful with DNA encoding the alpha subunit for the recombinant expression of biologically active human luteinising hormone
Disclosure; Column 13-14; 26pp; English.
The present invention describes isolated DNA encoding the beta-subunit of human luteinising hormone (hill), and having the sequence encoding the hill which is present in Escherichia coli clone pCL28xhoLHBVP (ATCC 39475). Products from the present invention can be used to produce the beta-subunit of hill can be used with an alpha-subunit encoding sequence to produce glycosylated, biologically active, heterodimeric hill for use in conditions associated with human fertility. The present sequence represents the human beta-subunit of follicle stimulating hormone
Disclosure; Column 13-14; 23pp; English.

The present invention describes new recombinantly produced biologically active heterodimeric active human fertility hormones selected from one of: human chorionic gonadotrophin (hCG), human luteinising hormone (hLH) and human follicle stimulating hormone (hLH) and human follicle stimulating hormone human origin. The present sequence represents human beta-FSH from the present invention. The hormones are used in human fertility treatment and the FSH can be especially used in diagnostic tests for fertility and pituitary functions. The hormones are free of contaminating proteins that would normally be found in preparations from natural

Disclosure; Fig 32B: 139pp; English.

The invention relates to the production of analogues of a heterodimeric subunit glycoprotein hormone (GPH) e.g. human chorionic gonadotropin (C C C), human luteinising hormone (NLH), human follicle stimulating hormone (hFSH), human thyroid stimulating hormone (hFSH), and functional miterins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit disulphide bond, improved stability, the analogue retaining at least a portion of the bloactivity for the corresponding native GPH receptor. This sequence bloactivity for the corresponding native GPH receptor. This sequence corresponding native GPH receptor. This sequence corresponding native GPH receptor. This sequence corrected GPHs. The improved analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have agonistic activity on them. The changes stabilise the GPHs and prolong the biological activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    W99546;

08-7UN-1999 (first entry)

NFSH-beta analogue hFSH-beta-52C.

Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH;

human chorionic gonadotropin; human luteinising hormone; disulphide bond;

human follicle stimulating hormone; human thyroid stimulating hormone;

stability; primer; amplification; PCR; mutation.
                                                                                                                08-JUN-1999 (first entry)
hFSH-beta analogue hFSH-beta-Y31C.
Analogue, heterodimeric, glycoprotein hormone; hCG; hLH; hFSH; hTSH; human chorionic gonadotropin; human luteinising hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

New stabilised glycoprotein hormones - particularly hGG, hIH, hFSH or hTSH, have an intersubunit disulphide crosslink between the PT alpha-and beta-subunits to improve stability

Example 12; Page 88; 139py; English.

Example 12; Page 88; 139py; English.

CC subunit glycoprotein hormone (GPH) e.g. human chorionic gonadotropin (CG), human luteinising hormone (HHH), human follicle stimulating hormone (hFSH), and functional conditions, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, of the improved stability, the analogue retaining at least a portion of the contactivity for the corresponding native GPH receptor. This sequence represents a mutated hFSH-beta subunit used for the generation of the modified GPHs. The improved analogues are designed specifically to reduce perturbation of the 3 dimensional structure of the hormone, thereby creating greater likelihood that the dimer will be formed dimer will have affinity for the native receptors and have agonistic activity on them. The changes stabilise the GPHs and prolong the bological activities of the hormones. The analogues can have uses Sc sequence 129 AA;
                       Disclosure; Fig 35, 139pp; English.

The invention relates to the production of analogues of a heterodimeric subunit glycoprotein hormone (GPH) e.g. human chorionic gonadotropin (hCG), human lutefalising hormone (HFH), human follicle stimulating hormone (hFSH), human thyroid stimulating hormone (hTSH), and functional muteins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a bera-subunit cysteine, for improved stability, the analogue retaining at least a portion of the bloactivity for the corresponding native GPH receptor. This sequence represents a mutant hFSH-beta subunit used for the generation of the modified GPHs. The improved analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have the biological activities of the hormones. The analogues can have uses as for the native GPHs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Glycoprotein hormone analogue hFSH-beta-BQ48C. Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human chorionic gonadotropin; human luteinising hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation.

Taylor and beta-subunits to improve stability between the stample 12; Page 88; 139pp; English.

Example 12; Page 88; 139pp; English.

The invention relates to the production of analogues of a heterodimeric subunit glycoprotein hormone (GPH) e.g. human chorionic gonadotropin (hCG), human luteinising hormone (hHH), human follicle stimulating normone (hFSH), and functional muteins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for improved stability, the analogue retaining at least a portion of the bloactivity for the corresponding native GPH receptor. This sequence represents a mutated hFSH-beta subunit used for the generation of the modified GPHs. The improved analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affainty for the native receptors and have agonistic activity on them. The changes stabilise the GPHs and prolong
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WELL 99-081219/07.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            agonistic activity on them. The changes stabilise the GPHs and prolong the biological activities of the hormones. The analogues can have uses as for the native GPHs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Glycoprotein hormone analogue hFSH-beta-T34C. Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human cobrionic gonadotropin; human luteinising hormone; disulphide bor human follicle stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New stabilised glycoprotein hormones - particularly hCG, hLH, hFSH or hTSH, have an intersubunit disulphide crosslink between the alpha- and beta-subunits to improve stability

Example 12; Page 88: 139pp; English.

Example 12; Page 88: 139pp; English.

The invention relates to the production of analogues of a heterodimeric subunit glycoprotein hormone (GPH) e.g. human chorionic gonadorropin (hCG), human luteinising hormone (hLH), human chorionic gonadorropin (hCG), human luteinising hormone (hTSH), and functional hormone (hFSH), human thyroid stimulating hormone (hTSH), and functional muteins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine, for muteins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for improved stability, the analogue retaining at least a portion of the bioactivity for the corresponding native GPH receptor. This sequence corresponding fractaining allowed are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have agonistic activity on them. The changes stabilise the GHS and prolong the formed and activities of the hormones. The analogues can have uses
                                                                                                                                                                                                     ö
               reduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer vill be formed in vivo and the formed dimer will have affinity for the native receptors and have agonistic activity on them. The changes stabilise the GPHs and prolong the biological activities of the hormones. The analogues can have uses sequence 129 AA;
                                                                                                                                                                                                                                                                                                                                                                                             Glycoprotein hormone analogue hFSH-beta-D36C.

New stabilised glycoprotein hormones - particularly hCG, hLH, hFSH or hTSH, have an intersubunit disulphide crosslink between the alpha- and beta-subunits to improve stability

Talpha- and beta-subunits to improve stability

Example 12; Page 88: 139pp; English.

The invention relates to the production of analogues of a heterodimeric the invention relates to the production of analogues of a heterodimeric cubunit glycoprotein hormone (GPH) e.g. human chorionic gonadotropin (hCG), human lutelnising hormone (hLH), human thyroid stimulating hormone (hTSH), and functional numbroved stability, the analogue retaining at least a portion of the botween an alpha-subunit cysteine and a beta-subunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit disulphide bond, improved stability, the analogue retaining at least a portion of the bloactivity for the corresponding native GPH receptor. This sequence corresponding native GPH receptor. This sequence bloactivity for the corresponding native GPH receptor. This sequence correct and the formed finer will have affinity for the native receptors and have agonistic activity on them. The changes stabilise the GPHs and prolong the bloogical activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
Glycoprotein hormone analogue hFSH-beta-K40C.

Glycoprotein hormone analogue hFSH-beta-K40C.

Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human chorionic gonadotropin; human man follicle stimulating hormone; human follicle stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
